The content of this Technical Reference was approved on 30 March 2020 by the Chemical Standards Committee (CSC) under the purview of the Singapore Standards Council.

First published, 2020

CSC consists of the following members:

	<b>Name</b>	<b>Representation</b>
<b>Chairman</b>	: Dr Keith Carpenter	<i>Individual Capacity</i>
<b>Deputy Chairman</b>	: Er. Lucas Ng Hong Kiang	<i>Individual Capacity</i>
<b>Secretary 1</b>	: Ms Elane Ng	<i>Standards Development Organisation@Singapore Chemical Industry Council</i>
<b>Secretary 2</b>	: Ms Rosmalinda Tay	<i>Standards Development Organisation@Singapore Chemical Industry Council</i>
<b>Members</b>	: Mr Goh Tiak Boon	<i>Individual Capacity</i>
	: Prof Alfred Huan	<i>Individual Capacity</i>
	: Er. Khong Beng Wee	<i>Individual Capacity</i>
	: Mr Terence Koh	<i>Singapore Chemical Industry Council Limited</i>
	: Dr Leong Kwai Yin	<i>Individual Capacity</i>
	: Dr Thomas Liew	<i>National Metrology Centre</i>
	: Mr Lim Eng Kiat	<i>Individual Capacity</i>
	: Mdm Jaime Lim	<i>Ministry of Manpower</i>
	: Mr Lim Kian Chye / Mr Ng Eng Fu	<i>Housing &amp; Development Board</i>
	: Prof Loh Kian Ping	<i>National University of Singapore</i>
	: Dr Loh Wah Sing	<i>Individual Capacity</i>
	: Ms Pamela Phua	<i>Singapore Paint Industry Association</i>
	: Mr Seah Khen Hee	<i>Individual Capacity</i>
	: A/Prof Timothy Tan	<i>Nanyang Technological University</i>
	: Dr Teo Tang Lin	<i>Chemical Metrology Division, Health Sciences Authority</i>
	: Mr Yao Yikai	<i>Maritime and Port Authority of Singapore</i>
	: Ms Suzanna Yap	<i>National Environment Agency</i>
<b>Co-opted Members</b>	: Ms Christina Loh	<i>Individual Capacity</i>
	: Mr Pitt Kuan Wah	<i>Individual Capacity</i>

CSC sets up the Technical Committee on Petroleum Processes and Products to oversee the preparation of this standard. The Technical Committee consists of the following members:

	<b>Name</b>	<b>Representation</b>
<b>Chairman</b>	: Er. Khong Beng Wee	<i>Individual Capacity</i>
<b>Secretary</b>	: Mr Teo Wen Liang	<i>Standards Development Organisation@Singapore Chemical Industry Council</i>
<b>Members</b>	: Mr Chung Tying Chun	<i>Setsco Services Pte Ltd</i>
	A/Prof Hong Liang	<i>National University of Singapore</i>
	Mr Kho Ho Meng	<i>Singapore Refining Company Private Limited</i>
	Er. Jacqueline Liew	<i>Ministry of Manpower</i>
	LTC Ng Geok Meng	<i>Singapore Civil Defence Force</i>
	Mr Poon Chiew Tuck	<i>National Environment Agency</i>
	Mr Sundar Rajaraman	<i>ExxonMobil Chemical Operations Private Limited</i>
	Dr Sin Siang Meng Ivan / Mr Koh Soon Chuang	<i>Institution of Fire Engineers, Singapore</i>
	Mr Soh Hong Chow	<i>SGS Testing &amp; Control Services Pte Ltd</i>
	Mr Tan Kian Hwee	<i>Sembcorp Industries Ltd</i>

The Technical Committee sets up the Working Group on Land Transportation, Handling and Storage of LNG to prepare this standard. The Working Group consists of the following experts who contribute in their *individual capacity*:

	<b>Name</b>
<b>Convenor</b>	: Mr Nicholas Yong Kok Choon
<b>Members</b>	: Mr Cai Zong Neng
	Mr Danny Chan
	Mr George Cui Jun Wu
	Mr Goh Hock Nguan
	Mr Desmond Lee
	Mr Gary Lim
	Mr Bentinck Ng Wei Hua
	Mr André Philippe du Plessis
	CPT Shavithiya Shanmugam
	Mr Siah Poh Chiang
	Mr Ken Tan
	Mr Jason Thong
	Ms Jan Woon
	Mr Nicholas Yip Wei Hao
	Mr Zheng Hui Jian

The organisations in which the experts of the Working Group are involved are:

*Air Products Singapore Industrial Gases Pte Ltd*

*American Bureau of Shipping*

*Bureau Veritas Singapore Pte Ltd*

*Energy Market Authority*

*FueLNG Pte Ltd*

*Gashubunited Utility Pte Ltd*

*Industrial Gas Association of Singapore*

## Foreword

This Technical Reference (TR) was prepared by the Working Group on Storage, Land Transportation and, Handling of LNG set up by the Technical Committee on Petroleum Processes and Products under the purview of CSC.

This TR helps to facilitate the storage, land transportation and handling of LNG for downstream end-users, as well as to support the sustainability of the industry by enabling the use of an alternative fuel and providing new growth opportunities to the growing trend of adopting small-scale LNG solutions in Singapore.

It also promotes the standardisation of equipment specifications and installation for storage tanks, transport tankers, and associated facilities, as well as ensuring personnel handling/operating the equipment are suitably trained and competent so as to enhance Singapore's current position as one of the world's largest bunkering port and its vision to become a major LNG trading hub in Asia.

This TR complements TR 56 which covers LNG delivery from LNG bunkering facilities to receiving ships through four modes of transfer (shore-to-ship, truck-to-ship, ship-to-ship bunkering and cassette bunkering).

This TR is expected to be used by any business entities that are interested in or involved with the storage, land transportation and handling of LNG in Singapore.

It is presupposed that in the course of their work, users will comply with all relevant regulatory and statutory requirements. Some examples of relevant regulations and acts are listed in the Bibliography. The Singapore Standards Council and Enterprise Singapore will not be responsible for identifying all of such legal obligations.

This TR is a provisional standard made available for application over a period of three years. The aim is to use the experience gained to update the TR so that it can be adopted as a Singapore Standard. Users of the TR are invited to provide feedback on its technical content, clarity and ease of use. Feedback can be submitted using the form provided in the TR. At the end of the three years, the TR will be reviewed, taking into account any feedback or other considerations, to further its development into a Singapore Standard if found suitable.

ISO 16924

Separation distances of stationary LNG fuelling installation

Table 4 of this TR was adapted from Table B.2 of ISO 16924. The following items were omitted from Table 4 as they are beyond the scope of this TR.

- LNG storage tanks 120 m<sup>3</sup> to 300 m<sup>3</sup>
- LNG storage tanks >300 m<sup>3</sup>
- Boundary limit – LNG tank offloading connection
- Overhead electric power lines, above 600 V
- Dispenser – Onsite buildings
- If dead man's button limits the accidental discharge to LNG to 60 s

Acknowledgement is made for the use of information from the above publications.

Attention is drawn to the possibility that some of the elements of this TR may be the subject of patent rights. Enterprise Singapore shall not be held responsible for identifying any or all of such patent rights.

**NOTE**

1. *Singapore Standards (SSs) and Technical References (TRs) are reviewed periodically to keep abreast of technical changes, technological developments and industry practices. The changes are documented through the issue of either amendments or revisions. Where SSs are deemed to be stable, i.e. no foreseeable changes in them, they will be classified as "Mature Standards". Mature Standards will not be subject to further review, unless there are requests to review such standards.*
2. *An SS or TR is voluntary in nature except when it is made mandatory by a regulatory authority. It can also be cited in contracts making its application a business necessity. Users are advised to assess and determine whether the SS or TR is suitable for their intended use or purpose. If required, they should refer to the relevant professionals or experts for advice on the use of the document. Enterprise Singapore and the Singapore Standards Council shall not be liable for any damages whether directly or indirectly suffered by anyone or any organisation as a result of the use of any SS or TR. Although care has been taken to draft this standard, users are also advised to ensure that they apply the information after due diligence.*
3. *Compliance with a SS or TR does not exempt users from any legal obligations.*

## Technical Reference – Code of practice for storage, land transportation and handling of LNG

### 0 Introduction

#### 0.1 Properties of LNG

Liquefied natural gas (LNG) is a colourless, odourless, non-toxic and non-corrosive fluid. During the liquefaction process, the natural gas (NG) is treated to remove most of the heavy hydrocarbons, water and other impurities such as carbon dioxide and hydrogen sulphide. LNG is maintained in a liquid state when it is stored at its boiling temperature of around -162 °C. In this condition, it can be maintained at near atmospheric pressure. In liquid form, the volume of NG is reduced by approximately 600 times. Storing and transporting LNG represents different challenges when compared to traditional oil-based liquid fuels, both as a cryogenic liquid and as a flammable gas. As a liquid, these challenges are primarily associated with the cryogenic hazards of a liquid stored at -162 °C. They include brittle fracturing of unprotected structures, cryogenic burns, pressure increases caused by rapid transition to a gas and possible asphyxiation hazards if collected in confined spaces.

The fire and explosion hazards presented by LNG are primarily a result of these factors:

- A lower flashpoint (the lowest liquid temperature at which, under certain standardised conditions, a liquid gives off vapours in quantity such as to be capable of forming a flammable mixture in the presence of air). For NG, this is approximately -187 °C, compared to traditional fuel oils, which have a flashpoint in excess of 60 °C.
- A higher auto-ignition temperature (the lowest temperature of a hot surface at which, under specified test conditions, an ignition occurs of a flammable gas or vapour in a mixture with air or air/inert gas). For NG, this is in the region of 580 °C to 600 °C.
- A flammable range of between a lower explosive limit (LEL) of 5 % and an upper explosive limit (UEL) of 15 % when mixed with air.
- Lower ignition energy. For natural gas/air mixtures, this is 0.25 mJ, which is lower than most other hydrocarbons.

The principal difference between LNG and oil-based liquid fuels, that drives the different statutory requirements, is the lower flashpoint of NG. Furthermore, low energy sparks have a higher risk of ignition for NG releases.

#### 0.2 Formation of LNG

Unrefined NG is a naturally occurring hydrocarbon gas mixture of methane and smaller fractions of other heavier hydrocarbons, (such as: ethane; propane; and butane), as well as various contaminants (such as: moisture (water); mercury; carbon dioxide; nitrogen; and hydrogen sulphide). LNG is NG that has been treated (to remove the contaminants, as well as excess heavy hydrocarbons) and then converted to its liquid state to make its storage and transportation more efficient.

As LNG is stored in its liquid state, the equipment used for transporting and storage of LNG is usually double-jacketed pressure vessels that are specially designed to be vacuum insulated.

Conversion of LNG to NG is typically undertaken by an ambient vaporiser, where the LNG is evaporated or vaporised from its liquid state to a gaseous state. The NG then passes through a pressure control manifold (PCM) which controls the pressure and flow to supply the downstream users via pipeline.

## 1 Scope

This TR sets out the design and operational requirements and recommendations for the inland handling, storage and land transportation of LNG.

This TR covers portable liquid cylinders (PLC), stationary storage facilities (e.g. microbulk tanks/bulk storage tanks) and the various means for transporting LNG applicable to bulk delivery and packaged gas delivery.

The maximum capacity of an individual stationary storage tank under this TR is 100,000 litres water capacity. Refer to 4.2.1.

This TR specifies the minimum requirements for the design, construction and operation of an onshore LNG storage tank farm and does not cover the following:

- LNG liquefaction plant design and installation;
- off-shore LNG installations (e.g. floating installations);
- facilities such as a PLC trans-fill terminal (with exception of the storage tank), or temporary LNG/NG facilities being used for activities such as equipment commissioning;
- underground LNG storage tanks;
- design and specification for LNG vehicle fuel tanks and fuel stations.

The operators/service providers conduct a risk assessment on the overall project design to ensure any potential risks are being addressed and mitigated.

Key hazardous scenarios in a risk assessment for the storage, land transportation and handling of LNG would be expected to include, but not limited to, the following:

- Tank over pressure;
- Tank over filling;
- Cold embrittlement of carbon steel equipment and/or structures;
- Loss of containment (leak) of LNG during unloading or loading operations;
- Formation and dispersion of cold vapour clouds of LNG via poor vent stack design or discharge of NG gas in the tank farm;
- Pipeline over pressure due to regulator failure;
- Rapid phase transition.
